

Revert the button alignment, fix the relearn note

Six steps in three files. Steps 1 to 3 put the Manage Filtering Laws button back to its simple left-aligned form. Steps 4 to 6 stop the relearn note covering the radio buttons.

Part 1 – revert the alignment attempts

Several attempts were made to move the button to the right of the preference page button bar. None worked: the bar is laid out by JFace after `contributeButtons` returns, and the bar itself has no layout data, so nothing set on the button survives. Left is also where Eclipse puts page-specific buttons by convention, and the button works correctly there, so this is logged as a minor cosmetic item and the code goes back to its simplest form.

Step 1 — HealthAlarmsPreferencePage – delete the field

mgs-health-app/.../preferences/healthalarms/HealthAlarmsPreferencePage.java

Delete this field if it is there. It was only added so `createControl` could reach the button afterwards, which is no longer needed.

```
// DELETE
private Button manageLawsButton;
```

Step 2 — HealthAlarmsPreferencePage – contributeButtons

Replace the whole method. `setButtonLayoutData` gives the button the same width and spacing as `Apply`, which is the only part of the styling that matters.

```
@Override
protected void contributeButtons(Composite parent) {
    ((GridLayout) parent.getLayout()).numColumns++;
    Button manageLaws = new Button(parent, SWT.PUSH);
    manageLaws.setText(Messages.CORE.getString("filteringLawManageButton"));
    manageLaws.addListener(SWT.Selection, e -> hac.openFilteringLawDialog());
    setButtonLayoutData(manageLaws);
}
```

Step 3 — HealthAlarmsPreferencePage – createControl

Replace the whole method. Only the `Restore Defaults` line remains; the alignment block goes.

```
@Override
public void createControl(Composite parent) {
    super.createControl(parent);
    Button defaults = getDefaultsButton();
    if (defaults != null) {
        defaults.setVisible(false);
    }
}
```

Nothing else in the class changes.

Part 2 – the relearn note covers the radio buttons

The note is drawn on top of the `Start learning with group`, hiding most of `No flight hours` and all of the second option. The cause is the group's own layout data: it is set to fill vertically and grab the extra space, so it claims the whole composite height and leaves nothing for the note below it.

Step 4 — CoreMessages.properties – remove the stray backslash

mgs-client-common/src/com/eurocopter/mgs/core/presentation/i18n/CoreMessages.properties

The text currently reads "The \ approved deviation is preserved" because of a line continuation. Put the message on one line with no backslash anywhere.

```
deviationRelearnNote=Relearning a threshold does not close any deviation set on it. The approved deviation is preserved.
```

Do the same in every language file.

Step 5 — LearningPastHoursSelectionComposite – let the group size itself

mgs-health-app/.../health/presentation/composite/LearningPastHoursSelectionComposite.java

Near the top of the constructor, find this line and replace it.

```
// BEFORE
root.setLayoutData(new GridData(SWT.FILL, SWT.FILL, true, true));

// AFTER
root.setLayoutData(new GridData(SWT.FILL, SWT.TOP, true, false));
```

SWT.FILL with `grabExcessVertical` true tells the group to take every spare pixel of height, which is what pushes it over the note. SWT.TOP with false makes it take only the height its contents need, leaving room underneath.

Step 6 — LearningPastHoursSelectionComposite – move the note to the end

The note block must be the last thing in the constructor, immediately before `this.pack();`. If it currently sits earlier, cut it and paste it here.

```
xLabelComposite.setLayoutData(new GridData(SWT.FILL, SWT.FILL, true, true));
Label xTextLabel = new Label(xLabelComposite, SWT.NONE);
xTextLabel.setText(Messages.CORE.getString("ThresholdLearningLastDownloadedHours"));
xTextLabel.setLayoutData(new GridData(SWT.FILL, SWT.CENTER, true, true));

// BCR-6605 relearning does not close a deviation
Label deviationNote = new Label(this, SWT.WRAP);
deviationNote.setText(Messages.CORE.getString("deviationRelearnNote"));
GridData noteData = new GridData(SWT.FILL, SWT.BEGINNING, true, false);
noteData.widthHint = 420;
deviationNote.setLayoutData(noteData);

this.pack();
}
```

The `widthHint` is what makes SWT.WRAP actually wrap. Without it the label reports its natural width as the full sentence and the dialog stretches instead of the text wrapping onto two lines.

Build and test

#	Action
1	Rebuild the client only.
2	Open Health – Manage Filtering Laws is on the left of the button row, same size as Apply, and opens the dialog
3	Open Health Analysis, pick an indicator with a Learned threshold such as RMSr, and open Threshold learning
4	Both radio buttons are fully visible: No flight hours, and the flight hours option below it
5	The note sits under both of them, wrapped onto two lines, with no backslash in the text
6	Nothing overlaps, and OK and Cancel are still reachable

If the note still overlaps after this, the composite's own layout is the problem rather than the group's – check what `LearningPastHoursSelectionComposite` is added to, and whether that parent gives it a height hint.
